# TDI PARKING CHECK ISSUING MACHINE

## **TIMES, DATES, IMPRINTS**

The machine contains an electrically powered, automatically set date and time recording mechanism for printing date and time. It carries an additional printing element for

printing incidental information. It is available with fee selection and imprinting component. It imprints as it feeds check into pick-up mouth.

## **ISSUES**

It imprints, cuts off and brings forth one parking check when car approaches over detector in roadbed or when release bar on issuing unit is pressed. It holds check in convenient position to be picked up by

the motorist and sounds a buzzer until the check has been picked up. No additional check can be brought forth until the first one has been taken.

## **GIVES IMPULSE**

As the check is taken, and only then, it furnishes an impulse to the entrance gate, entrance stop/go signal or other device, trig-

gering its actuation to admit the patron's vehicle.

**CHECK OF  
CONVENIENT SIZE**

The unit will imprint and issue parking checks 5" long by 2", 2½" or 3" wide, held in magazine for up to 4000 checks, put-up in fan-fold pack. The check may be partially or fully pre-printed on both sides and perforated. Red light on the machine case signals low supply of checks.

**RECORDS**

A non-resettable counter records every transaction.

**AUTOMATIC**

**WEATHERPROOF**

**JAMPROOF**
